Static Characteristics

Standard Application

※ Operation without dimming:

IO operates at rated current without dimming function when the pins of analog DIM and PWM DIM keep open

※ PWM Dimming Control (non DA type):

IO adjustment by PWM Signal

During PWM dimming operation, IO will change with the PWM duty (PWM Signal: 1K~10KHz)

Note: DALI dimming curve refer to 10KHz curve

※ Analog Dimming Control (non DA type):

IO adjustment by DC voltage

During analog dimming operation, IO will change with DC input voltage

※ DALI Dimming Control (DA type only):

IO adjustment by DALI signal

- DALI protocol including 16 groups and 64 addresses.
- Min. dimming level is about 8% of output.

■ Efficiency VS Output Voltage(Number of LEDs)

Application Notes:

- 1.The positive and negative input terminals must be connected correctly and negative voltage can not be input to avoid damage to the power supply.
- 2.Due to the large input current, please pay attention to the voltage drop of the wiring, to ensure the power supply to work properly.
- 3.When using the LEDS of different forward voltage, please pay attention to the min Load of DA-type to ensure that LED lights went out after DALI dimming off.
