2. Typical value at min. or max. input voltage and full load.

3. The input voltage can be increased to 42VDC by external capacitors.

3.1 For Positive output: Input capacitor is necessary when input voltage 36VDC increased to 42VDC. The input capacitor suggestion is 22uF.

3.2 For Negative output application:

The input and output capacitors are necessary for negative output application when the 36VDC increased to 42VDC,  
and the suggestion of capacitors: The C1 is 22uF and the C2 is 10uF. (Please refer to the figure of positive to negative output application)

Consider to the maximum duty of internal controller. In the trim down application, these are some condition that input range can't increase to 42VDC.

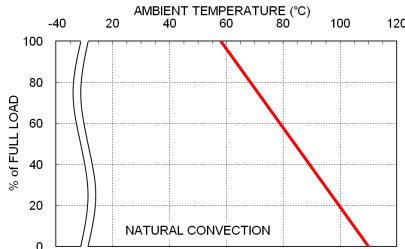

Model Number	Output voltage(Trim down)	Input range
SSR01-12S09	-4.5 ~ -6VDC	Vin +  Vout  ≤ 36VDC
SSR01-24S12	-4.5 ~ -6VDC	Vin +  Vout  ≤ 36VDC
SSR01-24S15	-4.5 ~ -6VDC	Vin +  Vout  ≤ 36VDC

4. Test by minimum input and constant resistive load.

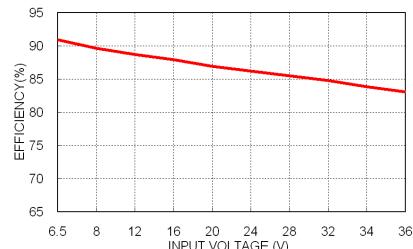

**CAUTION:** This power module is not internally fused. An input line fuse must always be used.

## FUSE CONSIDERATION

This power module is not internally fused. An input line fuse must always be used.

This encapsulated power module can be used in a wide variety of applications, ranging from simple stand-alone operation to an integrated part of sophisticated power architecture.

To maximum flexibility, internal fusing is not included; however, to achieve maximum safety and system protection, always use an input line fuse. The input line fuse suggest as below :

## POSITIVE OUTPUT

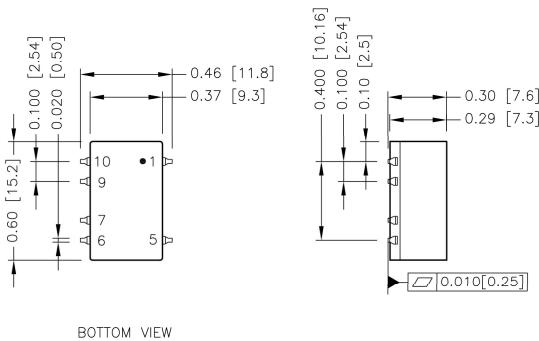

Model	Fuse Rating (A)	Fuse Type
SSR01-05S□□	2	Slow-Blow
SSR01-12S□□	2.5	Slow-Blow
SSR01-24S□□	1.6	Slow-Blow

## NEGATIVE OUTPUT

Model	Fuse Rating (A)	Fuse Type
SSR01-12S□□	1.6	Slow-Blow
SSR01-24S□□	1.25	Slow-Blow

## THERMAL CONSIDERATIONS

The power module operates in a variety of thermal environments.

However, sufficient cooling should be provided to help ensure reliable operation of the unit.

Heat is removed by conduction, convection, and radiation to the surrounding Environment.

Proper cooling can be verified by measuring the point as the figure below.

The temperature at this location should not exceed 85°C.

When Operating, adequate cooling must be provided to maintain the test point temperature at or below 85°C.

Although the maximum point Temperature of the power modules is 85°C, you can limit this Temperature to a lower value for extremely high reliability.

The unit will shutdown if the internal IC junction exceeds 170°C (typical), but the thermal shutdown is not intended as a guarantee that the unit will survive temperature beyond its rating. The module will automatically restarts after it cools down.
